## Investing for a more sustainable world

Social and environmental change is happening faster than ever. Global warming, shifting demographics and the technology revolution are reshaping our planet. In this fast changing world, there are a growing number of investors who want to understand how social and environmental change is affecting their investments, and how the way they invest affects the environment and society.

Research indicates that the majority of investors believe they can contribute to a more sustainable world through their investment choices and that additional information from financial advisers would encourage them to allocate more of their investment portfolio to sustainable investments<sup>1</sup>.

To help you meet your clients' needs, this guide covers the key things you should know about sustainable investing, including how to identify your clients' preferences.

### Sustainability factors are a key consideration for people in Australia when selecting investments<sup>1</sup>

**52%**

of people consider sustainability factors when selecting an investment product

**40%**

of people frequently invest in sustainable investment funds rather than those that don't consider sustainability factors

### Australian investors are paying increasing attention to investing sustainably

**65%**

of people are now driving the topic of sustainable investing with their advisers

**50%**

of people find sustainable funds attractive due to the wider environmental impact

<sup>1</sup> Schroders Global Investor Study 2020. Australian investor results.

## What is sustainable investing?

Sustainable investing focuses on generating returns that are sustainable into the future.

It involves considering more than just traditional analysis; it also pays attention to how non-financial factors such as Environmental, Social and Governance (ESG) considerations may impact an investment's ability to generate long-term returns. The idea is that those companies actively preparing themselves for future risks and opportunities by recognising their social and environmental impact will have better long-term prospects than those that don't. Their ability to generate sustainable financial returns should therefore be superior to those that take a shorter-term view.

## Why has it become so important?

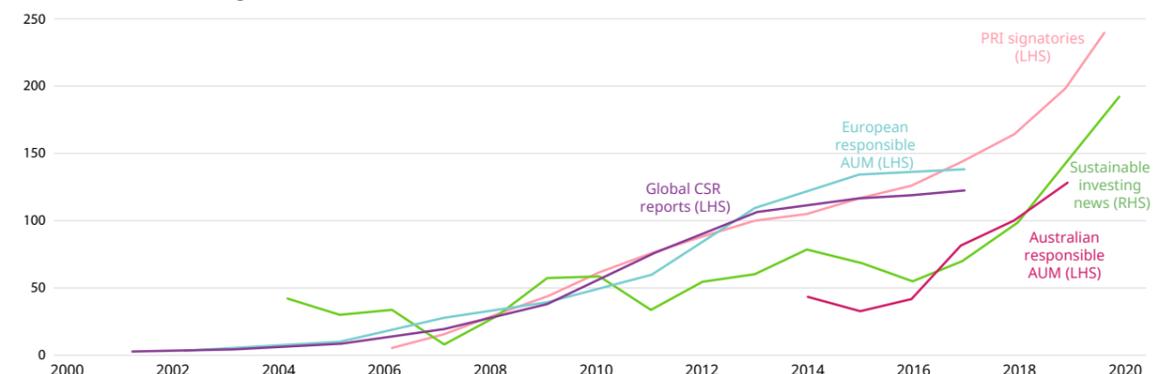

Social and environmental trends pose increasingly significant risks to investments, to a point where they can no longer be ignored. Moreover, it is increasingly being considered a normal part of best interests duty to clients to consider ESG factors.

It's no longer about profits above all else. How a company makes its money is just as important as how much it makes. As a result, investors are demanding more from their investments; more transparent reporting, greater commitment to tackling social and environmental issues, and more concrete evidence of them having done so.

People all over the world are becoming increasingly conscious of acting in the best interests of the environment and society at large. As a result, investors are increasingly looking to invest in a way that reflects these personal values.

### Sustainability has moved from niche to mainstream

Interest, demand and sophistication are on the rise  
Indexed, 2008 to 2018 average = 100

Source: Hightail (news search for articles containing 'sustainable investing' relative to all articles referring to 'investing', principles for responsible investment (number of signatories) and EuroSIF (combined AUM invested in different ESG strategies, adjusted for double-counting). Latest available data as at 7 May 2020.

## How does this affect me as an adviser?

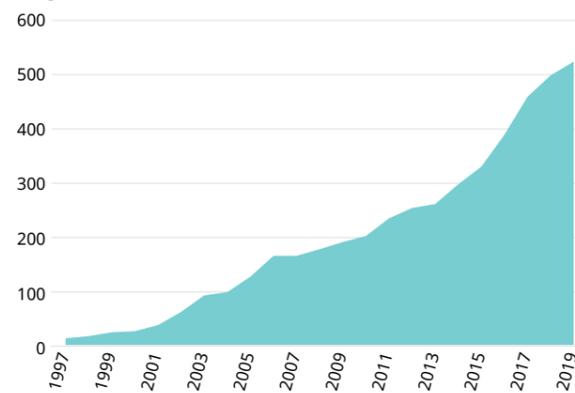

With this rise in popularity has come increased regulatory scrutiny, along with higher standards and expectations for advisers in their duty of care for clients.

The new FASEA Code of Ethics in Australia, which came into effect in 2020, requires advisers to consider clients' broader, long-term interests and likely circumstances. This also includes consideration for reducing advice to only ethical or responsible investments, where in the client's best interests. These changes now arguably require you to incorporate a client's sustainability preferences into their suitability assessment. It will not be enough to simply tick a box confirming you've asked a client about their sustainability needs; taking sustainability considerations into the advice process is now a requirement that you will need to evidence as compliance with these standards.

Firstly, you need to determine and record your client's sustainability preferences and take this into account along with the other factors in your suitability assessment when you make your recommendation. This will involve helping your client identify whether and how they would like to incorporate environmentally sustainable investments, social investments or good governance investments into their investment strategy.

To be clear, sustainability considerations don't take priority over other suitability criteria, they are designed to be an additional way to provide insights into your client's needs. Based on this information, you can then start to recommend suitable products. You will also need to disclose all the ESG-related features of the products you propose and be able to provide evidence that you have done so.

### ESG regulations and amendments in the top 50 largest economies

Source: PRI and Schroders as at June 2020

## Asking the right questions

While ascertaining your client's sustainability preference is an increasingly important part of the advice process, it's also crucial that you form a holistic view of their underlying needs and desires.

For example, investors don't just invest to make money; they also invest for expressive and emotional reasons. The questions you ask your clients should therefore delve deeper into understanding these reasons and try

to address their need for financial security, for nurturing their families, for staying true to their values and for gaining social status. Understanding these aspects will help you establish a more realistic and meaningful view of what your clients want to achieve with their investments.

The chart below may help with your client conversations and understand where on the sustainable investing spectrum your client lies based on their priorities and sustainability preferences.

### Financial benefits

### Social impact

- Does your client want to maximise their investment opportunity set but ensure financially material risks relating to E, S or G issues are taken into account in the investment decision-making process?
- Does your client have a preference for engagement and encouraging better ESG performance over divestment?

If yes

**Integrated**

- Does your client only want to invest in those companies at the forefront of sustainability practices and stakeholder management?
- Are there specific sustainability themes they would like to gain exposure to/their investments to prioritise?
- Are there specific investments or areas of the market they wish to avoid?

If yes

**Sustainable**

- Does your client have religious, ethical or personal values that they wish to be reflected in their investments?
- Are there specific investments or areas of the market they wish to avoid?
- Do they wish to exclude companies directly involved in those areas or also those that are indirectly involved?

If yes

**Screened**

- Does the client want their investment to deliver a specific, positive, measurable social and/or environmental benefit alongside a financial return?
- Is there appetite to potentially invest in private markets to achieve this?

If yes

**Impact**

- Is your client most focused on maximising their social impact?
- Are they willing to donate their money to good causes?

If yes

**Philanthropy**

## Fund search considerations

Once you've determined your client's goals and which strategy is likely to best suit them, you can start to look for funds that meet their needs.

With a growing number of funds being launched under the broader "sustainable investing" umbrella, asking the right questions during this process to understand what different funds are trying to achieve is key. Here are some suggestions to start you off.

 Integrated	 Sustainable	 Screened	 Impact
<ul style="list-style-type: none"> <li>- Does the fund systematically consider ESG factors throughout the investment process, and if so, how does it do so?</li> <li>- Can the manager evidence this with examples rather than just using their status as a signatory to the UN PRI as proof?</li> <li>- Does the manager outsource the ESG analysis to a third party ratings provider or have they developed their own, more sophisticated approach?</li> <li>- How do they engage and what outcomes do they seek?</li> <li>- Do they have a voting policy? Is their voting record consistent with their voting policy?</li> </ul>	<ul style="list-style-type: none"> <li>- Does the fund target a specific sustainability theme (e.g. environmental solutions, education, diversity) or outcomes (e.g. a lower carbon intensity)?</li> <li>- How does the fund positively select the best performing companies from a sustainability perspective?</li> <li>- How do the managers invest responsibly and hold companies to account?</li> <li>- Does the fund apply any exclusions? How are these determined?</li> </ul>	<ul style="list-style-type: none"> <li>- Does the fund exclude investments in specific companies or activities?</li> <li>- How are these exclusions defined? For example, is a revenue threshold applied?</li> <li>- Are exclusions based on company exposure to a controversial activity throughout its entire value chain, or just during production?</li> <li>- Roughly how much of the benchmark is excluded from investment? What impact might this have on the fund's performance and risk?</li> </ul>	<ul style="list-style-type: none"> <li>- Does the fund target a specific social or environmental impact/outcome as well as financial returns?</li> <li>- Can the manager demonstrate a clear link between the capital provided and the positive social or environmental impact?</li> <li>- Does the manager clearly demonstrate and regularly report on the fund's impact?</li> </ul>

## Helping your clients make the right choices

Talking through these options doesn't guarantee your client will want to invest sustainably.

You could consider the four-step EAST model to encourage positive and sustainable financial behaviour from your clients.

1. **Make it Easy.** Presenting your clients with default options helps; this has been proven effective in plans for pension contributions.
2. **Make it Attractive.** For example, encouraging a sense of civic duty in a client's plan can be very powerful, whilst being careful to attach financial incentive.
3. **Make it Social.** Within the constraints of client confidentiality, clients are more likely to support a plan if they have socialised it with the people most important to them. This is especially powerful in next generation family wealth transition planning, but it is rarely used.
4. **Make it Timely.** Immediate benefits encourage action. Just the feeling of having contributed to sustainability can help clients feel better very quickly.

### Adviser checklist

#### Start

a conversation with your clients on sustainable investing

#### Ask

your clients the right questions – understand and record their sustainability preferences

#### Search

for a sustainable investment solution

#### Present

your client with a sustainable investment strategy. Enhance your client's knowledge with our guides, glossaries and ongoing sustainability content.

## Answering your clients' questions

There are a number of myths surrounding sustainable investing. We expect your clients will want to know whether these are true or not, so here are some common questions and possible answers to support you with these conversations.

### **Is there a trade-off between performance and sustainable investing?**

Sustainable investing is not about sacrificing financial returns. The goal is still to make money but in a more responsible, long-term way. While there are other influences (some of which may be outside a company's control) that will affect how well a company does over time, several academic studies have shown a connection between sustainability factors and improved performance. One study (Friede & Busch 2015) found that companies focused on ESG enjoyed, on average, enhanced financial performance, while analysis by Arabesque Asset Managers and Oxford University show that good sustainability practices positively impact share prices. Morgan Stanley has also done research that shows sustainable funds can help protect investors against downside risk.

### **Are sustainable funds expensive?**

Historically, sustainable funds have been more expensive than their traditional counterparts because it used to be something of a niche area that required specialist skills. But now sustainable options have become more widespread and the skillset more prevalent.

Sustainable funds have become more competitively priced compared to traditional funds, and in many cases cost the same as a traditional fund.

### **Must I avoid 'sin' stocks?**

This is entirely up to you. With such a wide range of sustainable funds on offer, there's no reason why you should have to invest in a fund that doesn't completely align with your values and beliefs. If you want to exclude such stocks, you should focus on funds that screen for these types of companies and actively avoid investing in them so that you have nothing to do with them.

### **Should I avoid fossil fuels given the scale of the global climate challenge?**

Again, this is entirely up to you. If investing in such companies isn't in line with your beliefs then you can invest in funds which exclude investment in fossil fuels. If you don't want to exclude them entirely, but are still worried about the potential investment risks, you can always look at funds with an integrated approach to investing. Here, individual companies or activities are not excluded, but they are held at a weight that reflects their risk. Managers are usually committed to actively engaging with them to improve the sustainability of their business practices and corporate behaviour to mitigate potential risks arising from the negative impact they are having on the environment or society.

## The important role of advisers

Sustainable investing is becoming increasingly popular as investors look for ways in which to align their investments with their personal beliefs.

As an adviser, you have an important role to fulfil; you can help your clients meet both their financial and sustainability objectives, and feel more engaged and emotionally connected with their investments.

This guide should help you navigate this growing field, understand your client preferences and recommend investment options that best suit their needs and circumstances.

## Demystifying sustainable jargon

The field of sustainable investing has become a sea of acronyms and technical terms, which can leave investors confused. We've put together a glossary of some of the key terms to know.

### 2°C limit or "2 degrees"

It is widely agreed that limiting the average rise in global temperatures to less than 2°C above pre-industrial levels by the end of this century may help stave off the worst of the natural disasters associated with global warming.

### Active ownership

Actively exercising your shareholder rights and engaging with investee companies to encourage responsible corporate behaviour and improve long-term shareholder value.

### Carbon footprint

A measure of a group, individual or a company's total greenhouse gas emissions.

### Carbon pricing

The cost of emitting CO2 into the atmosphere, either in the form of a fee per tonne of CO2 emitted, or an incentive that's offered for emitting less. Putting an economic cost on emissions is widely considered the most efficient way to encourage polluters to reduce what they release into the atmosphere.

### Divestment

The sale of any investment related to controversial activities for social or political goals. For example, investors divested from South African assets during the apartheid era in protest against the regime.

### ESG

Environmental, Social and Governance.

### ESG criteria

A set of standards that investors use to screen potential investments. Environmental criteria consider how a company performs as a steward of nature. Social criteria examine how it manages relationships with employees, suppliers, customers, and the communities where it operates. Governance deals with a company's leadership, executive pay and shareholder rights.

### ESG integration

An investment approach that takes into consideration a range of environmental, social and governance-related risks and opportunities, in addition to traditional financial analysis.

### Greenwashing

Falsely communicating the environmental benefits of a product, service or organisation in order to make a company seem more environmentally-friendly than it really is.

### Impact investing

Investments that are made with the intention of achieving specific, positive, measurable social and/or environmental benefits alongside a financial return.

### Impact measurement

This is not the same as impact investing. It is the measurement of how companies' activities affect the world both positively and negatively. Schroders developed [SustainEx](#) for this purpose, to measure the effect on companies' profitability if their negative social or environmental impacts or benefits were recognised financially.

### Screening

An investment approach used to filter companies based on pre-defined criteria before investment. As an investor, you can use a negative screen (in which you deliberately exclude certain companies because of their involvement in undesirable activities or sectors) or a positive screen (in which you select companies based on their sustainability practices). In the jargon, this can also be a "best-in-class investment" – where you only invest in companies that lead their peer groups in terms of sustainability practices and performance.

### Sin stocks

Stocks of companies associated with activities considered to be unethical or immoral, such as tobacco, alcohol, gambling and adult entertainment.

### Stewardship

An ongoing dialogue between shareholders and boards that aims to ensure a company's long-term strategy and day-to-day management is effective and aligned with shareholders' interests.

### Transition risk

The financial risks that could result from significant policy, legal, technology and market changes as we transition to a lower-carbon global economy and climate resilient future.

### UN Sustainable Development Goals (SDG)

A collection of 17 goals reflecting the biggest challenges facing global societies, environments and economies today.

## Schroders – a leader in sustainable investing

If you've found our guide insightful, why not contact your usual Schroders representative to see how we can help you and your clients deliver sustainable long-term value in a fast changing world. We are fully ESG integrated across all of our managed assets, and have an A+ UN PRI annual assessment and a Top 10 ShareAction Responsible Investment Survey of global asset managers.

Schroders is a leader in sustainable investing. We are rated highly in this area by ShareAction, a non-governmental organisation (NGO), and have an A+ rating from the Principles for Responsible Investment (PRI), a United Nations organisation<sup>2</sup>.
