Investment objective and strategy

For clients who wish to achieve investment returns in excess of cash and government bonds, can tolerate moderate equity-like investment risk and accept there is a risk of capital loss as capital markets fluctuate. The portfolio uses a blend of active and passive assets with active management on both a long-term and an opportunistic basis in order to pursue its objectives, including an allocation to equity or equity-like investments and non-base currencies in pursuing its aims. There is always likely to be a material allocation to cash, bonds and other defensive assets. The aim of the portfolio is that, in the longer term, the value of the assets should be protected against the impact of inflation.

Economic overview

Economic data continues to point to a strong recovery, with US output estimated to have increased at an annualised rate of 6.4% in the first quarter. Equity and bond markets have generally shrugged off the latest figures, suggesting that a substantial recovery has already been priced in. The US and UK, which have fully vaccinated 38% and 25% of their adult populations respectively, are enjoying the fastest growth. However, the pace of recovery from the pandemic remains very uneven. India, in particular, is struggling with a devastating resurgence in cases. Commodity prices continued their rise last month, with industrial metals and agricultural products seeing particularly sharp increases. In many cases, the moves reflect the combination of surging demand as lockdowns come to an end and restricted supply. This will undoubtedly feed through into higher headline inflation readings over the coming months. However, we share the Fed's view that this will prove to be a transitory spike.

Portfolio overview

April was another risk on month with equities up strongly. Performance was broad based across sectors and styles, whilst geographically the UK, Europe and US did particularly well. The top performing holdings in the models were the Vanguard US Equity Index and L&G Global Technology Index Trust. All of our bond holdings produced positive returns, whilst our position in the Troy Trojan Fund also performed well.

What are the risks?

Prior to making an investment decision, please consider the following risks:

- (i) Interest rate risk:** For models investing in fixed income, changes in interest rates are likely to affect the asset's value. In general, as interest rates rise, the price of a fixed bond will fall and vice versa.
- (ii) Credit risk:** The value of the model may fall if the companies and governments who have issued the bonds deteriorate in quality, or in the worst case scenario become insolvent.
- (iii) Liquidity risk:** It may be difficult to sell some investments (or sell them without making a loss) due to an insufficient number of buyers in the market.
- (iv) Currency risk:** The model can hold some investments that are not denominated in UK Pound Sterling (£). These may be affected by changes in currency exchange rates.
- (v) Emerging market risk:** The model invests in markets where economic, political and regulatory factors can be significant. This may affect the liquidity, settlement and asset values. Any such event can have a negative effect on the value of your investment. Investments in emerging markets can demonstrate significant declines in value over extended periods of time.

Important Information

Past performance is not a guide to future performance. The value of an investment and the income from it may go down as well as up and investors may not get back the amount originally invested.
